

You have stood over that shot a hundred times in practice. You know exactly how to make it. And then, in front of everyone, your hand does something your brain never told it to do.

This is not a technique problem.

This book is about the half-second before the stroke. The moment where everything you have ever practiced either shows up or abandons you. The gap between the player you are and the player you know you can be has nothing to do with your cue, your stance, or your practice hours.

It lives entirely between your ears.

Competitive Pool draws on neuroscience, EEG brain-state data from real pool players under pressure, and voices from some of the best instructors and competitors in the game to answer the one question every serious player asks after a loss:

Why couldn't I just play my game?

Now you will know. And you will know what to do about it.

All proceeds from this book go first to a friend of the author who is fighting cancer, and then to training minorities with professional instructors.

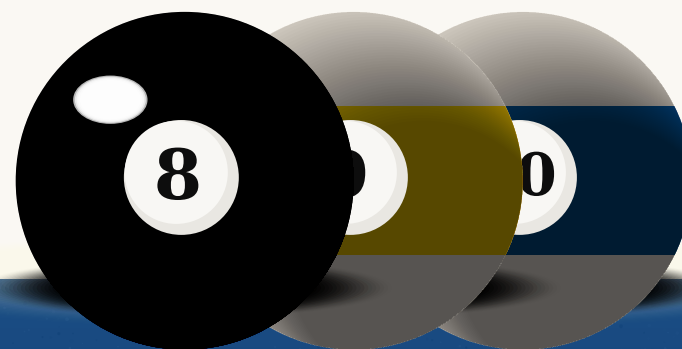

Pool Why Skill Alone Is Not Enough
